Emacs 基本快捷键：

Minimally functional commands:

Note that C means Control and M means meta (which is the escape key on the mac rather than alt – annoying because I can touch type alt but not escape)

- C-x, C-f – open a file

- C-x, C-s – save current file – I use this one a lot!

- C-x, C-c – quit emacs

- C-x 0 (that is a zero) – close the current split window and merge into one

- C-x o (that is a lower case o) – switch between split windows

- C-x 2 – split into two buffers – I actually stopped using this pretty quickly as I found it easier to have two tabs with emacs open. I've seen multiple buffers used very effectively though.

- C-c, C-s – open sml RPEL – I stopped using this quickly as well

- Cx Cc – prompt to save and exit

- C-D – restart RPEL – stopped using as well

- M-p -previous RPEL – stopped using as well

   Second iteration of using emacs better – navigating with the keyboard

- C-a – beginning of line

- C-e – end of line

- C-v – page down

- M-v page up – note must re-press escape each time

- C-s – regular expression search

   Third iteration

- C-k – delete to end of line

- M < – beginning of file (yes that is escape + shift + , on a mac

- M > – end of file
